Purchasers can usually download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1920 edition. Excerpt: . . . OF NON-FERROUS METALS A Brief Comparison, Which Points Out the Superiority of this Equipment over the Direct and Indirect Arc, and the Semi and True Induction Types. T. F. BAILY, President, The Electric Furnace Co. Before going into the manufacture of nonferrous melting furnaces, a careful survey was made of the development work that had been carried on in other types, to determine whether these types met all of the responsible requirements for a successful melting unit. The first type to be considered was the direct arc type, but the experience that had been had with this type of furnace readily indicated that in non-ferrous metals containing zinc. the direct arc type could not be used without a deep bath of slag overlaying the metal, so that the intense heat of the arc might be entirely diffused before it reached the molten metal. Some furnaces of this type had been put into commercial operation, and excellent brass and bronzes had been produced. However, from an operating standpoint, especially in foundries, it was readily apparent that the deep slag bath of several inches thickness was such a serious annoyance that it was hardly probable that this type of furnace could be placed on the market successfully. The next type was the indirect arc type. which offers some advantages in the low zinc alloys, and one of these types, the Reunerfelt, has met with conspicuous success in the manufacture of cupro-nickle alloys; but the high temperature...
