*The publication is simple in go through preferable to fully grasp. I am quite late in start reading this one, but better then never. It is extremely difficult to leave it before concluding, once you begin to read the book.*

## CONCRETE HYDRATION BASED ON ELECTRICAL RESISTIVITY MEASUREMENT

Condition: New. Publisher/Verlag: VDM Verlag Dr. Müller | Cement and Concrete Research | The hydration process of concrete has been studied using a non-contact electrical resistivity measurement. Cement hydration stages have been classified and the hydration mechanism has been interpreted based on the analysis of resistivity development curve and the investigations of microstructure. The proposed concrete conduction model shows that the degree of hydration dominates concrete resistivity. It also proposes some practical applications of the resistivity measurement in the activity evaluation of mineral admixtures, the selection of a superplasticizer and the determination of concrete setting time. A criterion has been proposed for selecting a suitable superplasticizer. The more suitable superplasticizer is the one which gives the mixture a higher  $K_r$  and a higher  $K_t$  at the saturation dosage. The quantitative relationship between the setting time of concrete measured with the traditional penetration resistance method and the time at which the electrical resistivity critical points occurred has been developed. The electrical resistivity measurement can be used as an alternative method to determine the setting times of concrete. | Format: Paperback | Language/Sprache: english | 200 gr | 221x150x10 mm | 140 pp.
