

Probabilistic Models of Population Evolution: Scaling Limits and Interactions (Mathematical Biosciences Institute Lecture Series)

By Etienne Pardoux

Springer. Paperback. Condition: New. 126 pages. This expository book presents the mathematical description of evolutionary models of populations subject to interactions (e. g. competition) within the population. The author includes both models of finite populations, and limiting models as the size of the population tends to infinity. The size of the population is described as a random function of time and of the initial population (the ancestors at time 0). The genealogical tree of such a population is given. In their typical models, the population is bound to go extinct in finite time. It is explained when the interaction is strong enough so that the extinction time remains finite, when the ancestral population at time 0 goes to infinity. The material could be used for teaching stochastic processes, together with their applications. Etienne Pardoux is Professor at Aix-Marseille University, working in the field of Stochastic Analysis, in particular Stochastic partial differential equations. He obtained his PhD in 1975 at University of Paris-Sud. This item ships from multiple locations. Your book may arrive from Roseburg, OR, La Vergne, TN. Paperback.

Reviews

This is an incredible book that I have ever read through. It can be really exciting through reading through time period. I discovered this publication from my i and dad recommended this pdf to find out.

-- Friedrich Lynch DDS

Basically no words to describe. We have read through and i also am sure that i am going to going to read once more once again later on. You may like just how the article writer compose this publication.
