

Fecal DNA Testing in Screening for Colorectal Cancer in Average-Risk Adults: Comparative Effectiveness Review Number 52

Filesize: 6.73 MB

Reviews

A very amazing publication with perfect and lucid information. We have read through and that i am certain that i will planning to study once more yet again in the future. You will not really feel monotony at anytime of the time (that's what catalogues are for about should you question me).

FECAL DNA TESTING IN SCREENING FOR COLORECTAL CANCER IN AVERAGE-RISK ADULTS: COMPARATIVE EFFECTIVENESS REVIEW NUMBER 52

[DOWNLOAD PDF](#)

CreateSpace Independent Publishing Platform. Paperback. Condition: New. This item is printed on demand. 86 pages. Dimensions: 11.0in. x 8.5in. x 0.2in. Colorectal cancer (CRC) is the third most common cancer in both men and women and is the third leading cause of cancer deaths in the United States. Incidence and mortality rates for CRC have declined over the past two decades, corresponding with an increase in self-reported screening rates. However, screening rates remain suboptimal. While different U. S. guideline-issuing organizations agree on the majority of recommended CRC screening options, there are differences between some recommended options, such as fecal DNA testing. In 2008, the United States Preventive Services Task Force (USPSTF) found that evidence was insufficient to recommend fecal DNA testing for CRC screening. However, the American Cancer Society (ACS), the U. S. Multi-Society Task Force (MSTF) on Colorectal Cancer, and the American College of Radiology (ACR) collectively recommended fecal DNA testing as an alternative screening method. The ACS-MSTF-ACRs recommendation was based on a lower threshold of evidence than that of the USPSTF. Fecal DNA tests are designed to detect molecular abnormalities in cells from cancer or precancerous lesions that are shed into the stool. Fecal DNA testing to screen for CRC has evolved significantly over time, both in improvements in understanding relevant molecular abnormalities associated with CRC and technological advances to allow for improved detection of molecular abnormalities in DNA in the stool. Molecular abnormalities that have served as the basis for CRC screening tests have focused on three major genetic mechanisms: chromosomal instability due to abnormalities in mutational hotspots like APC, KRAS, and TP53; microsatellite instability due to loss of function of mismatch repair genes that can result in accumulation of errors within the DNA sequence; and DNA methylation, an epigenetic alteration, in which promoter sites of genes are...
