

Parallelization, Scalability, and Reproducibility in Next-Generation Sequencing Analysis

By Köster, Johannes

Book Condition: New. Publisher/Verlag: epubli | This PhD thesis provides novel solutions to major topics within the analysis of next-generation sequencing data, focusing on parallelization, scalability and reproducibility. | The analysis of next-generation sequencing (NGS) data is a major topic in bioinformatics: short reads obtained from DNA, the molecule encoding the genome of living organisms, are processed to provide insight into biological or medical questions. This thesis provides novel solutions to major topics within the analysis of NGS data, focusing on parallelization, scalability and reproducibility. The read mapping problem is to find the origin of the short reads within a given reference genome. We contribute the q-group index, a novel data structure for read mapping with particularly small memory footprint. The q-group index comes with massively parallel build and query algorithms targeted towards modern graphics processing units (GPUs). On top, the read mapping software PEANUT is presented, which outperforms state of the art read mappers in speed while maintaining their accuracy. The variant calling problem is to infer (i.e., call) genetic variants of individuals compared to a reference genome using mapped reads. It is usually solved in a Bayesian way. In this work, we show how to integrate filtering of variants into the calling with an algebraic approach and provide an intuitive solution...

Reviews

Basically no phrases to spell out. It is actually really interesting through studying time. You can expect to like just how the article writer create this publication.
-- **Braden Leannon**

This composed book is wonderful. It is amongst the most awesome book i actually have read through. You will like the way the author create this publication.
