Extrait: . . . of a bacterium presenting the greatest morphological analogies with that of chicken cholera; it is oblong, short, and appears bi-lobed in stained preparations on account of the greater affinity of its extremities for the coloring matters. The microbes of duck cholera are a little larger than those of chicken cholera. Like the latter they do not admit of double staining. Their culture on the different solid media is richer than that of chicken cholera. This peculiarity is especially noticeable upon potato, which is a very bad field for the growth of the organism of chicken cholera, whilst that of duck cholera grows very well on this medium. Whilst chicken cholera is pathogenic for ducks, duck cholera is inoffensive for chickens and pigeons. The latter disease does not even kill all ducks with the same rapidity; some species resist for a longer time than others. The rabbit succumbs..
