Suppose angle C = 30s, consequently angle C = 60, and leg AB = 56; required the leg BC, and hyp. AC. The three angles of any plane triangle are together = 180; consequently the two oblique angles will be complements of each other. OPERATION. . 64 X 64 144 72 30)4096(39 TTi Si--AB 39 676 75 675 72 32 104: 86; 33: 27 17 =y/C 62.43= A. Note: All cases in oblique-angled trigonometry triangles having no right angle may be solved by the above theorem, having first drawn a perpendicular from one of the angles to the opposite side or its production, and thus forming two right-angled triangles, either distinct from each other, or one included in the other, according as the perpendicular falls within or without the triangle--observing, that the perpendicular be so drawn, that in one of the right-angled triangles thus formed, two parts, besides the right angle, may be given. In the case when the three sides are given, the perpendicular may be drawn to the greatest side from its opposite angle, and then the segments of the base, or side on which the perpendicular falls, may be found thus: multiply together the sum and difference of the other two sides, and divide...
