Condition: New. Publisher/Verlag: Springer, Berlin | With contributions by numerous experts | This extensive and well-prepared manual is the work product of Klaus and Yvette Draenert, who are deeply interested in cemented total hip arthroplasty and in particular, intensely involved in related research for the past 25 years. Their damage analysis is aimed at cement fixation with the purpose to rule out any risk for the patient. They introduce the theme with a wide review of the literature on the successes and failures of the various types of total hip components. Because of the lack of standardization of the various parameters used in these studies, they do not recommend any special type, and on the basis of this literature study they wonder why there is such a search for new types and (fixation) methods of total hip arthroplasties. Instead of these long-term follow-up studies, the authors plead to carry out systematic histological research on retrieved human material as was firstly started and recommended by the late Sir John Charnley. Their investigations demonstrate that polymethylmethacrylate behaves biologically as an inert material that can be integrated into the bone, without a fibrous membrane interface. This could also be assessed in their animal experiments when the appropriate biomechanical conditions are provided. To achieve a connective tissue free bone-cement junction it is important to prevent deformation in the bone structures and micromotion between the bone-cement interface. | 1 Historical Background.- 1.1 Conditions Before Charnley.- 1.2 John Charnley.- 2 Histomorphology of the Bone-to-Cement Contact.- 2.1 The Cemented Total Hip Arthroplasty.- 2.2 Histomorphology of the Bone-to-Cement Contact (Animal Experiments).- 2.2.1 Changes Around Normal Bone Cements.- 2.2.2 TCP/HA Bone Cements.- 2.3 Histomorphology of Human Samples.- 2.3.1 Material and Methods.- 2.3.2 Summary of Results.- 3...
