Excerpt from On the Surface Temperature of the North Sea and of the North Atlantic When we have defined, in regard to the main temperature wave, the mean-value and the half-range, we get, by addition or subtraction of this latter value from the former, to what we may call the Mean Maximum and the Mean Minimum temperatures. They are not strictly the mean maxima or mean minima of the year, for to determine these we should have to take into our calculations the influence of the half-yearly and other higher oscillations of temperature. But as a rule even the half-yearly fluctuation is of no great magnitude, and the higher oscillations are very small indeed, so small that we can scarcely say whether they are real phenomena or (as is much more probable) are mere appearances due to our imperfect data. In any case, the approximate Mean Maxima and Minima, as we have defined them, - the maxima and minima, that is to say, of the fundamental Sine - wave, - are features of considerable interest, whose local variations are often well worth studying. Let us now begin, after this short introduction, to consider the main results of our temperature investigations. Our object is to understand the temperature phenomena of the North Sea, and of the waters which surround the other coasts of our own islands. But all our coastal waters are but a part of the great system of waters of the Atlantic Ocean, and we cannot properly understand any of our local phenomena without some preliminary knowledge of the ocean temperatures of the whole North Atlantic basin. The temperature phenomena of the ocean are closely inter connected with the system of...
