Condition: New. Publisher/Verlag: LAP Lambert Academic Publishing | Conventional bacterial indicators continue to be the gold standard useful in assessment of the water quality. However, the presences of viable but non culturable bacteria continue to cause serious outbreaks through using water contaminated by pathogens for drinking and/or recreational purposes. The aim of this work was to combine the culture method with PCR both monoplex and multiplex in order to determine the potential risk of examined water. Culture methods were used to detect bacterial indicators and selected pathogenic bacteria namely *Escherichia coli* O157:H7, *Legionella* spp. and *Helicobacter pylori*. Furthermore, the PCR was used to detect *E. coli* O157:H7 and a multiplex PCR was used to simultaneously detect the selected six virulence genes (*flic*, *stx1*, *stx2*, *eae*, *rfbE* and *hly*). One hundred seventy five different water samples were collected from Egypt. Water samples were collected from River Nile (Rossita Branch), the Mediterranean Sea, water drainage, hospital wastewater and groundwater. *Legionella* spp. and *H. pylori* were detected by culture methods on selective media in 25 and 33% of the examined water samples, respectively. | Format: Paperback | Language/Sprache: english | 304 pp.
