Condition: New. Publisher/Verlag: Springer, Berlin | Representation Theory, Orthogonal Polynomials, and Quantum Interpolations | In this volume the author further develops his philosophy of quantum interpolation between the real numbers and the p-adic numbers. The p-adic numbers contain the p-adic integers Z_p which are the inverse limit of the finite rings Z/p^n . This gives rise to a tree, and probability measures w on Z_p correspond to Markov chains on this tree. From the tree structure one obtains special basis for the Hilbert space $L^2(Z_p, w)$. The real analogue of the p-adic integers is the interval $[-1, 1]$, and a probability measure w on it gives rise to a special basis for $L^2([-1, 1], w)$ - the orthogonal polynomials, and to a Markov chain on "finite approximations" of $[-1, 1]$. For special (γ and β) measures there is a "quantum" or "q-analogue" Markov chain, and a special basis, that within certain limits yield the real and the p-adic theories. This idea can be generalized variously. In representation theory, it is the quantum general linear group $GL_n(q)$ that interpolates between the p-adic group $GL_n(Z_p)$, and between its real (and complex) analogue - the orthogonal O_n (and unitary U_n) groups. There is a similar quantum interpolation between the real and p-adic Fourier transform and between the real and p-adic (local unramified part of) Tate thesis, and Weil explicit sums. | Introduction: Motivations from Geometry.- Gamma and Beta Measures.- Markov Chains.- Real Beta Chain and q-Interpolation.- Ladder Structure.- q-Interpolation of Local Tate Thesis.- Pure Basis and Semi-Group.- Higher Dimensional Theory.- Real Grassmann Manifold.- p-Adic Grassmann Manifold.- q-Grassmann Manifold.- Quantum Group $U_q(\mathfrak{su}(1, 1))$ and the q-Hahn Basis. | Format: Paperback | Language/Sprache: english | 380 gr | 236x156x14 mm | 222 pp.
