Rarebooksclub.com, United States, 2012. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book ***** Print on Demand *****.This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1909 Excerpt: . the other at the centre. If the compression line of the offending end is above that of the other end, it proves that its discharge valves are leaking back, and if the line is below, the fault is with the suction valves. In plotting adiabatic curves on diagrams, Mr. Voorhees, in his useful little book, *Indicating the Refrigerating Machine*, has given us a set of constants for various back pressures. I make the following suggestion, which I believe to be an improvement in practical accuracy and ease of working--its theoretical accuracy I cannot vouch for. An examination of Mr. Voorhees s tables reveals to you that all of his numbers in any one column bear the same ratio to the first as any other corresponding number does to the first of its column. I give a list of these ratios in Table II. They are the same as Mr. Calculated from *Indicating the Refrigerating Machine*, by Gardner T. Voorhees. Voorhees would have put in his book if he had calculated for one pound back pressure. On the diagram, Fig. 1, I lay off the absolute zero line below the atmospheric line, according to the scale of the spring used. Then with the 100th scale I measure the vertical distance from this line to the beginning of the compression line. This, in hundredths of an inch, is my base figure. The diagram is divided into ten parts by vertical lines, according to Mr. Voorhees s instructions....
